Condition: Acne / Inflammation

Confidence: 42.29%

1 Simple explanation

Acne is a skin condition that causes small bumps, pimples, or whiteheads to appear on the face, chest, or back. It happens when the skin's oil glands become clogged and inflamed.

2 Common symptoms

- Red or inflamed bumps on the skin
- White or yellow heads on top of pimples
- Small blackheads that look like tiny spots
- Occasional pain or tenderness in the affected area
- Occasionally swelling or a rash around the bumps

3 Possible causes

- Excess oil production by the skin
- Dead skin cells that get trapped in pores
- Bacteria that live on the skin surface
- Hormonal changes, especially during puberty or menstrual cycles
- Certain medications or cosmetics that irritate the skin
- Stress or lack of sleep that can affect the body's balance

4 Practical treatment

Home remedies

- Wash the face twice a day with a gentle cleanser.
- Apply a small amount of over-the-counter salicylic acid or benzoyl peroxide gel.
- Use a cold compress to reduce swelling.
- Avoid picking or squeezing pimples to keep bacteria from spreading.

Medical treatment

- If over-the-counter products do not help, a dermatologist can prescribe stronger topical creams or oral antibiotics.
- For severe acne, treatments such as topical retinoids, hormonal therapy, or light therapy may be recommended.

5 When to consult a doctor

- The bumps last longer than two weeks.
- The skin shows signs of infection such as increased redness, pus, or swelling.
- There are many cystic or painful nodules that do not improve with home care.
- Acne is affecting your emotional well-being or self-confidence.
- You notice new or unusually large bumps that are hard to treat at home.

6 Prevention tips

- Keep the skin clean by washing the face twice daily.
- Use oil-free or non-comedogenic skincare products.
- Avoid touching the face with dirty hands.
- Do not rub or scratch pimples.
- Use a clean pillowcase and wash it often.
- Eat a balanced diet, drink plenty of water, and get enough sleep.
- Manage stress with relaxation techniques or exercise.
